

**IN THE CLAIMS**

Please replace all prior versions, and listings, of claims in the application with the following list of claims. Additions are indicated by underlining and deletions are indicated by strikeouts.

1. (Original) A method comprising:  
forming at least one waveguide, and a cladding contacting the waveguide, each from a common prepolymer, the waveguide and cladding having a refractive index difference.
2. (Original) A method as in claim 1, involving exposing a portion of the common prepolymer to a first amount of polymerizing energy to form the at least one waveguide and exposing a second amount of a common prepolymer to a second amount of polymerizing energy to form the cladding.
3. (Original) A method as in claim 2, wherein the polymerizing energy is electromagnetic radiation.
4. (Original) A method as in claim 1, comprising:  
curing an array of at least two essentially parallel lines of a fluid prepolymer to a first extent to form at least two essentially parallel lines of polymeric material cured to a first extent;  
contacting the at least two lines of cured polymeric material with a portion of the fluid prepolymer and curing the portion to a second extent to form a portion of the polymeric material cured to the second extent contacting the lines of polymeric material cured to the first extent.
5. (Original) A method comprising:  
forming a waveguide and cladding; and  
altering a refractive index ratio between a waveguide and cladding.
6. (Original) A method as in claim 5, the waveguide and cladding each being formed of a polymeric material.

7. (Original) A method as in claim 5, the waveguide and cladding each defining a polymeric material formed from a common prepolymeric material.
8. (Original) A method as in claim 5, the altering step involving curing the waveguide and cladding, together, after formation.
9. (Withdrawn) A method comprising:  
simultaneously deforming at least two guided, propagating electromagnetic waves.
10. (Withdrawn) A method comprising:  
introducing electromagnetic radiation into a first waveguide, allowing the electromagnetic radiation to couple from the first waveguide into a second waveguide, and allowing the electromagnetic radiation to couple from the second waveguide into a third waveguide.
11. (Withdrawn) A method comprising:  
forming a waveguide array of at least two waveguides having a coupling characteristic between them;  
guiding electromagnetic radiation using the waveguide array by introducing the electromagnetic radiation into the array and causing the radiation to be essentially totally internally reflected within pathways of the array; and  
altering the coupling characteristic of a section of the array including at least a portion of each waveguide to alter the coupling characteristic of the waveguides relative to each other.
